

## X versus Y variables interaction

pairplot provides a visual overview of the relationships between all feature pairs, colored by the prescribed drug.

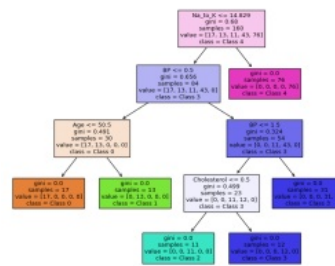

- Strongest positive correlations:
  - Age and Blood\_Pressure (0.65)
  - Sodium to Potassium and Drug (0.59)
- Strongest negative correlation:
  - Cholesterol and Drug (-0.43)

- Drug Y is the most commonly prescribed, followed by Drug X.
- Drugs A, B, and C are prescribed less frequently
- Patients prescribed Drug B tend to be older
- Patients with high blood pressure (BP = 2) are more likely to receive Drug C.
- Drugs A and B are commonly prescribed for low blood pressure (BP = 0).
- High cholesterol (Cholesterol = 1) is a common factor for patients receiving Drugs A, B, and C.
- Patients on Drug Y generally have higher sodium to potassium ratios.

Decision Tree Visualization

- Na\_to\_K <= 14.83, BP <= 0.50, Age <= 50.50: This path results in class: 0.  
 Na\_to\_K <= 14.83, BP <= 0.50, Age > 50.50: This path results in class: 1.  
 Na\_to\_K <= 14.83, BP > 0.50, BP <= 1.50, Cholesterol <= 0.50: This path results in class: 2.  
 Na\_to\_K <= 14.83, BP > 0.50, BP <= 1.50, Cholesterol > 0.50: This path results in class: 3.  
 Na\_to\_K > 14.83: This path results in class: 4
